

Just like various other businesses or farming businesses, minimum requirements regarding aspects are required technical aspects that must be mastered by floriculture industry players/owners and workers who manages it. Nowadays the situation is much easier to gain knowledge and references from various sources relating to certain issues, for example about fertilization, pest and disease control as well as post-harvest measures.

However, amidst this convenience, it must be acknowledged that there is a risk in simplifying problems combined with a lack of basic knowledge, can lead perpetrators into error into more complex problems. Especially if a problem occurs 'irreversible' so that permanent damage occurs to the garden. For example, now it happens often mismanaging health problems because the patient is a know-it-all due to having too much access Social media is generally popular on the basis of testimonials and success stories, however without receiving assistance from competent medical personnel. If there's a problem health is so easy, of course it doesn't require expensive schooling and a long time to become a medical professional.
